Peak Current	6 A		
Continuous Current	3 A		
Supply Voltage	20 - 80 VDC		

ASSINITIES IN Ching Serve Orige

Description

The CABE6A80 PWM servo drive is designed to drive brushless and brushed DC motors at a high switching frequency. The CABE6A80 is fully protected against overvoltage, over-current, over-heating, and short-circuits. A single digital output indicates operating status. The drive interfaces with digital controllers that have analog ±10V output. The CABE6A80 can utilize quadrature encoder inputs for velocity control.

See Part Numbering Information on last page of datasheet for additional ordering options.

Features

- Four Quadrant Regenerative Operation
- Built-in regenerative and shunt regulator
- Lightweight
- High Switching Frequency
- High Performance Thermal Dissipation
- Differential Input Command

- Digital Fault Output Monitor
- Encoder Velocity Mode
- Current Monitor Output
- Compact Size
- High Power Density
- Velocity Monitor Outputs

HARDWARE PROTECTION

- Over-Voltage
- Over-Current
- Over-Temperature
- Short-circuit (phase-phase)
- Short-circuit (phase-ground)

INPUTS/OUTPUTS

- Digital Fault Output
- Digital Inhibit Input
- Analog Current Monitor
- Analog Command Input
- Analog Current Reference

COMMUTATION

Trapezoidal

FEEDBACK SUPPORTED

- Encoder
- Hall Sensors
- Tachometer (± 60 VDC)

MODES OF OPERATION

- Current
- Duty Cycle (Open Loop)
- Encoder Velocity
- Tachometer Velocity

MOTORS SUPPORTED

- Three Phase (Brushless)
- Single Phase (Brushed, Voice Coil, Inductive Load)

COMMAND SOURCE

±10 V Analog

Notes

1. Maximum duration of peak current is ~2 seconds. Peak RMS value must not exceed continuous current rating of the drive.

2. Lower inductance is acceptable for bus voltages well below maximum. If the motor inductance is lower than the minimum inductance, please contact the factory for customized modification.

HARDWARE SETTINGS

Switch Functions

The DIP Switch bank is located on the underside of the drive. The tables below describe switch functionality.

Switch	Description	Setting		
Owner	Description	On	Off	
1	Duty Cycle mode selector. Activates internal PWM feedback.	Duty Cycle mode	Other modes	
2	Activate velocity feedback or monitor. For Encoder Velocity mode, activates feedback. For Current mode, activates velocity monitor.	Active	Inactive	
3	Current mode selector.	Current mode	Other modes	
4 Velocity feedback polarity. Changes the polarity of the internal feedback signal and the velocity monitor output signal. Inversion of the feedback polarity may be required to prevent a motor run- away condition.		Standard	Inverted	

Mode Selection Table

	SW1	SW2	SW3
CURRENT	OFF	ON	ON
DUTY CYCLE	ON	OFF	OFF
ENCODER VELOCITY*	OFF	ON	OFF
TACHOMETER VELOCITY	OFF	OFF	OFF

*NOTE: See details of switch 4 for further Encoder Velocity configuration information.

Jumper Settings

Jumpers are SMT, 0 ohm resistors located on the underside of the drive PCB. By default, the drive is configured with the jumpers installed. Typical drive operation will not require the jumpers to be removed. Please contact the factory before jumper removal.

Jumper	Description	Configuration	
	SMT Jumper (0Ω Resistor)	Not Installed	Installed
JE1	Inhibit logic. Sets the logic level of inhibit pins. Labeled JE1 on the PCB of the drive.	Low Enable	Low Inhibit
JE2	JE2 Hall sensor phasing. Selects 120 or 60 degree commutation phasing. Labeled JE2 on the PCB of the drive.		120 degree

Potentiometer Functions

Potentiometers are located between the PCB and the drive baseplate, and are accessible from the side. Potentiometers are approximately linear and have 12 active turns with 1 inactive turn on each end.

Potentiometer	Description	Turning CW	
1	Loop gain adjustment for duty cycle / velocity modes. Turn this pot fully CCW in current mode. Located closest to the corner of the PCB.	Increases gain	
2	Offset. Used to adjust any imbalance in the input signal or in the amplifier. Located furthest from the corner of the PCB.	Adjusts offset in negative direction
